ENRIQUES INVOLUTIONS ON SINGULAR K3 SURFACES OF SMALL DISCRIMINANTS: COMPUTATIONAL DATA

ICHIRO SHIMADA

1. Introduction

This note is an explanation of the computational data obtained in the second half of the paper [2] (joint work with Davide Cesare Veniani). The data are available from the author's webpage:

`http://www.math.sci.hiroshima-u.ac.jp/~shimada/K3andEnriques.html`

The data consists of 11 files, each of which contains a `record` of `GAP` [1] that describes a data of the singular $K3$ surface X with the transcendental lattice T_X:

(1.1)

`Xd3a2b1c2`	:	$T_X = [2, 1, 2]$
`Xd4a2b0c2`	:	$T_X = [4, 0, 2]$
`Xd7a2b1c4`	:	$T_X = [2, 1, 4]$
`Xd8a2b0c4`	:	$T_X = [2, 0, 4]$
`Xd12a2b0c6`	:	$T_X = [2, 0, 6]$
`Xd12a4b2c4`	:	$T_X = [4, 2, 4]$
`Xd15a2b1c8`	:	$T_X = [2, 1, 8]$
`Xd16a4b0c4`	:	$T_X = [4, 0, 4]$
`Xd20a4b2c6`	:	$T_X = [4, 2, 6]$
`Xd24a2b0c12`	:	$T_X = [2, 0, 12]$
`Xd36a6b0c6`	:	$T_X = [6, 0, 6]$

Each of these records is written in the `txt` file with the same name.

In the file `NKrecs.txt`, we give a list of 7 records `NKrec`, each of which describes the nef-chamber of an Enriques surface with finite automorphism group.

Every lattice L is equipped with a basis, which is fixed during the whole calculation. The dual lattice $L^\vee$ is regarded as a submodule of $L \otimes \mathbb{Q}$, and hence its elements are given by a vector with rational components.

The discriminant form $q(L)$ of an even lattice L is described by a record, whose components are explained in Section 3. In particular, the natural projection $L^\vee \to L^\vee/L$ and the automorphism group $\mathrm{O}(q(L))$ are given in this record, and the natural homomorphism $\mathrm{O}(L) \to \mathrm{O}(q(L))$ is calculated by means of this record.

Supported by JSPS KAKENHI Grant Number 15H05738, 16H03926, and 16K13749.

2. Xrec

Let `Xrec` be one of the records in (1.1). Then `Xrec` has the following components:

- `Xrec.GramTX`: The Gram matrix of T_X.
- `Xrec.GramSX`: The Gram matrix of S_X.
- `Xrec.GramHX`: The Gram matrix of $H^2(X, \mathbb{Z})$.
- `Xrec.GramL`: The Gram matrix of L_{26}.
- `Xrec.GramR`: The Gram matrix of the orthogonal complement $R := [\iota_X]^\perp$ of the image of $\iota_X : S_X \hookrightarrow L_{26}$.
- `Xrec.m2R`: The list of (-2)-vectors of R.
- `Xrec.embTXHX`: The embedding of T_X into $H^2(X, \mathbb{Z})$.
- `Xrec.embSXHX`: The embedding of S_X into $H^2(X, \mathbb{Z})$.
- `Xrec.embSXL`: The embedding of S_X into L_{26}.
- `Xrec.embRL`: The embedding of R into L_{26}.
- `Xrec.projHXTX`: The othogonal projection $H^2(X, \mathbb{Q}) \to T_X \otimes \mathbb{Q}$.
- `Xrec.projHXSX`: The othogonal projection $H^2(X, \mathbb{Q}) \to S_X \otimes \mathbb{Q}$.
- `Xrec.projLSX`: The othogonal projection $L_{26} \otimes \mathbb{Q} \to S_X \otimes \mathbb{Q}$.
- `Xrec.projLR`:The othogonal projection $L_{26} \otimes \mathbb{Q} \to R \otimes \mathbb{Q}$.
- `Xrec.OTX`: The elements of the group $\mathrm{O}(T_X)$.
- `Xrec.OR`: The elements of the group $\mathrm{O}(R)$.
- `Xrec.qTX`: The record of $q(T_X)$ (see Section 3).
- `Xrec.qSX`: The record of $q(S_X)$ (see Section 3).
- `Xrec.qR`: The record of $q(R)$ (see Section 3).
- `Xrec.kerOTXOqTX`: The elements of the kernel of the natural homomorphism $\mathrm{O}(T_X) \to \mathrm{O}(q(T_X))$.
- `Xrec.imageOTXOqTX`: The elements of the image of the natural homomorphism $\mathrm{O}(T_X) \to \mathrm{O}(q(T_X))$.
- `Xrec.imageOROqR`: The elements of the image of the natural homomorphism $\mathrm{O}(R) \to \mathrm{O}(q(R))$.
- `Xrec.isomqSXqTX`: The isomorphism $q(S_X) \to -q(T_X)$ induced by $H^2(X, \mathbb{Z})$.
- `Xrec.isomqTXqSX`: The inverse of `Xrec.isomqSXqTX`.
- `Xrec.isomqSXqR`: The isomorphism $q(S_X) \to -q(R)$ induced by L_{26}.
- `Xrec.isomqRqSX`: The inverse of `Xrec.isomqSXqTR`.
- `Xrec.OTXomega`: The elements of $\mathrm{O}(T_X, \omega)$.
- `Xrec.OqTXomega`: The elements of $\mathrm{O}(q(T_X), \omega)$.
- `Xrec.OqSXomega`: The elements of $\mathrm{O}(q(S_X), \omega)$.
- `Xrec.OqRomega`: The image of $\mathrm{O}(q(S_X), \omega)$ by the isomorphism $\mathrm{O}(q(S_X)) \to \mathrm{O}(q(R))$ induced by L_{26}.
- `Xrec.weyl`: The Weyl vector $\mathbf{w}$ for the Conway chamber inducing D_0.
- `Xrec.weylS`: The image of the Weyl vector $\mathbf{w}$ by the orthogonal projection $L_{26} \to S_X$.

- `Xrec.autXD0`: The elements of the group $\mathrm{aut}(X, D_0)$.
- `Xrec.D0wallorbitrecs`: The list of records `orbrec` that describe orbits of the walls of D_0 under the action of $\mathrm{aut}(X, D_0)$. Each `orbrec` has the following components. Let w be a representative of the orbit o described by `orbrec`.
  - `orbrec.definingv`: The primitive vector v of $S_X^\vee$ that defines the representative w of o.
  - `orbrec.definingvs`: The list of primitive vectors of $S_X^\vee$ that define the walls in o.
  - `orbrec.n`: $n = \langle v, v \rangle$.
  - `orbrec.a`: $a = \langle \mathbf{w}_S, v \rangle$.
  - `orbrec.size`: The size $|o|$ of `orbrec.definingvs`.
  - `orbrec.innout`: If w is inner, then `"inner"`, whereas if w is outer, then `"outer"`.

  If w is inner, then `orbrec` has the following components. If w is outer, then the components below are the string `"not defined"`.
  - `orbrec.type`: The type (no.) of the orbit of inner-walls given in Tables of [2].
  - `orbrec.roots`: The list of (-2)-vectors r of L_{26} such that $\langle \mathbf{w}, r \rangle = 1$ and that $(r)^\perp$ passes through $\iota_X(w) \subset \mathcal{P}_{26}$.
  - `orbrec.adetype`: The ADE-type of a fundamental root system `orbrec.roots`, which is a list of strings `"A1", "A2", ..., "E8"`.
  - `orbrec.adjweyl`: The Weyl vector $\mathbf{w}'$ corresponding to an Conway chamber C' that induces the $\iota_X^* \mathcal{R}_{26}^\perp$-chamber D' adjacent to D_0 across the wall w.
  - `orbrec.adjweylS`: The projection of $\mathbf{w}' \in L_{26}$ to $S_X^\vee$, which is the image of `Xrec.weylS` by an extra automorphism g_S associated with w
  - `orbrec.gL`: An isometry $g_L \in \mathrm{O}^+(L_{26})$ that maps C_0 to C', preserves S_X, and such that $g_L|S_X$ is an element of $\mathrm{aut}(X)$ that maps D_0 to D'.
  - `orbrec.gS`: An isometry $g_S \in \mathrm{aut}(X)$ that is an extra automorphism associated with w.
  - `orbrec.dg`: The degree $\langle \mathbf{w}^{g_S}, \mathbf{w} \rangle$.
- `Xrec.D0wallrecs`: The list of records `wallrec` that describe the walls of D_0. Each record `wallrec` has the following components.
  - `wallrec.no`: The number (index) of the wall, which will be used in `facerec` below.
  - `wallrec.definingv`: The primitive vector v of $S_X^\vee$ that defines the wall w.
  - `wallrec.innout`: If w is inner, then `"inner"`, whereas if w is outer, then `"outer"`.

  - `wallrec.type`: If w is inner, then the type given in Tables of [2]. If w is outer, then `"not defined"`.
  - `wallrec.extraaut`: If w is inner, then an extra automorphism $g \in \mathrm{aut}(X)$ associated with w. If w is outer, then `"not defined"`.
- `Xrec.facerecs`: The list of records that describe the N_X-inner faces of D_0. An $\mathrm{aut}(X)$-equivalence class of N_X-inner faces of D_0 is described by a record `facerec` whose components are as follows. Let f be a representative of the $\mathrm{aut}(X)$-equivalence class.
  - `facerec.no`: The number (index) of this $\mathrm{aut}(X)$-equivalence class, which will be used in `enrrec` below.
  - `facerec.dim`: The dimension of f.
  - `facerec.basis`: A basis of the vector subspace $\langle f \rangle$ of $S_X \otimes \mathbb{Q}$.
  - `facerec.passingwalls`: The list of `wallrec.no` of walls of D_0 containing f.
  - `facerec.Gammaf`: A list $\Gamma(f)$ of elements of $g \in \mathrm{aut}(X)$ such that $\{D_0^g \,|\, g \in \Gamma(f)\}$ is equal to $\mathcal{D}(f)$ and that, if $g \neq g' \in \Gamma(f)$, then $D_0^g \neq D_0^{g'}$.
  - `facerec.autXf`: The list of elements of the group $\mathrm{aut}(X, f)$,
  - `facerec.orbrecs`: The list of $\mathrm{aut}(X, D_0)$-orbits contained in this $\mathrm{aut}(X)$-equivalence class of N_X-inner faces of D_0. Let o be an $\mathrm{aut}(X, D_0)$-orbit in this $\mathrm{aut}(X)$-equivalence class. Then o is described by the record `orbrec` with the following components. Let f' be a representative of o.
    * `orbrec.size`: The size of o.
    * `orbrec.g`: An element $g \in \mathrm{aut}(X)$ such that $f^g = f'$.
    * `orbrec.passingwalls`: The list of `wallrec.no` of walls of D_0 containing f'.
    * `orbrec.passingwalltypes`: The list of `wallrec.type` of walls containing f'.
- `Xrec.Yrecs`: The list of records that describe the Enriques involutions on X (see Section 4).

3. discrec

The discriminant form $q(L)$ of an even lattice L of rank r with a fixed basis is described by a record `discrec`. We put

$$A(L) := L^\vee/L \cong \mathbb{Z}/a_1\mathbb{Z} \times \cdots \times \mathbb{Z}/a_l\mathbb{Z}$$

and fix, one and for all, a set of generators $\bar{v}_1, \dots, \bar{v}_l$ of $A(L)$, where $\bar{v}_i$ is a generator of the ith component $\mathbb{Z}/a_i\mathbb{Z}$. Let $b(L) \colon A(L) \times A(L) \to \mathbb{Q}/\mathbb{Z}$ be the bilinear form associated with the quadratic form $q(L) \colon A(L) \to \mathbb{Q}/2\mathbb{Z}$. The record `discrec` has the following components.

- `discrec.discg`: The list $[a_1, \dots, a_l]$.
- `discrec.discf`: The Gram matrix of $q(L)$, whose (i,j)-component is $q(L)(\bar{v}_i) \in \mathbb{Q}/2\mathbb{Z}$ if $i = j$ and $b(L)(\bar{v}_i, \bar{v}_j) \in \mathbb{Q}/\mathbb{Z}$ if $i \neq j$.
- `discrec.lifts`: The list of vectors $v_1, \dots, v_l \in L^\vee$, where $\bar{v}_i = v_i \mod L$.
- `discrec.proj`: The $r \times l$ matrix M such that $v \mapsto vM$ gives the natural projection $L^\vee \to A(L)$, where $v \in L^\vee$ is written as a vector of length r with rational components with respect to the basis of L.
- `discrec.Oq`: The list of elements of $\mathrm{O}(q(L))$.

Note that, by this record, we can calculate the action $q(g) \in \mathrm{O}(q(L))$ of a given isometry g of L on $q(L)$.

4. Enrrec

An Enriques involution $\varepsilon \in \mathrm{aut}(X)$ on X is is described by a record `enrrec` whose components are as follows.

- `enrrec.no`: The number of ε in Table (Enriques involutions) of [2].
- `enrrec.fenr`: The number `facerec.no` of the $\mathrm{aut}(X)$-equivalence class of N_X-inner faces containing f_ε.
- `enrrec.invol`: The matrix representation of $\varepsilon \in \mathrm{O}^+(S_X)$.
- `enrrec.GramSY`: The Gram matrix of S_Y.
- `enrrec.GramP`: The Gram matrix of the orthogonal complement P of the image of $\pi^* \colon S_Y(2) \hookrightarrow S_X$.
- `enrrec.embSY2SX`: The embedding $\pi^* \colon S_Y(2) \hookrightarrow S_X$.
- `enrrec.embPSX`: The embedding $P \hookrightarrow S_X$.
- `enrrec.projSXSY2`: The orthogonal projection $S_X \otimes \mathbb{Q} \to S_Y(2) \otimes \mathbb{Q}$.
- `enrrec.projSXP`: The orthogonal projection $S_X \otimes \mathbb{Q} \to P \otimes \mathbb{Q}$.
- `enrrec.m4P`: The list of (-4)-vectors of P.
- `enrrec.autXenrfenr`: The list of elements of $\mathrm{aut}(X, \varepsilon, f_\varepsilon)$.
- `enrrec.kerres`: The list of elements of the kernel of the restriction homomorphism $\mathrm{aut}(X, \varepsilon, f_\varepsilon) \to \mathrm{aut}(Y, E_0)$. The quotient of `enrrec.kerres` by $\langle \varepsilon \rangle$ is identified with the kernel of $\rho_Y \colon \mathrm{Aut}(Y) \to \mathrm{aut}(Y)$.
- `enrrec.autYE0`: The list of elements of $\mathrm{aut}(Y, E_0)$.
- `enrrec.E0NKtype`: The Nikulin-Kondo type of the walls of E_0. For the Enriques involution No. 24 in Table (Enriques involutions) of [2], this data is `"not defined"`.
- `enrrec.E0walls`: The list of walls of defining (-2)-vectors of the walls of E_0.
- `enrrec.E0wallrecs`: The list of records `E0wallrec`, each of which describes a wall w of E_0. The components of the record `E0wallrec` are as follows.

  - `E0wallrec.no`: The number of the wall. Except for the Enriques involution No. 24, the walls are numbered according to the corresponding Nikulin-Kondo configuration recorded in `NKrecs` (see Section 5), and hence this numbering coincides with the figures of Nikulin-Kondo configurations in [2].
  - `E0wallrec.definingv`: The (-2)-vector $r \in \mathcal{R}_Y$ of S_Y that defines the wall w of E_0.
  - `wallrec.innout`: If w is inner, then `"inner"`, whereas if w is outer, then `"outer"`.
  - `E0wallrec.embwSX`: A basis of the minimal linear subspace of $S_X \otimes \mathbb{Q}$ containing $\pi^*(w) \subset \mathcal{P}_X$.
  - `E0wallrec.passingwalls`: The list of `wallrec.no` of walls of D_0 passing through $\pi^*(w) \subset \mathcal{P}_X$.
  - `E0wallrec.fenrw`: If w is inner, then the `facerec.no` of the $\mathrm{aut}(X)$-equivalence class of N_X-inner faces containing $f_\varepsilon(w)$. If w is outer, then `"not defined"`.
  - `E0wallrec.extraaut`: If w is inner, then an extra automorphism $g \in \mathrm{aut}(X, \varepsilon)$ associated with w. If w is outer, then `"not defined"`.
  - `E0wallrec.extraautY`: If w is inner, then the automorphism $g|S_Y \in \mathrm{aut}(Y)$, where $g \in \mathrm{aut}(X, \varepsilon)$ is `E0wallrec.extraaut`. If w is outer, then `"not defined"`.
- `enrrec.autXenrgenerators`: A generating set of $\mathrm{aut}(X, \varepsilon)$.
- `enrrec.autYgenerators`: A generating set of $\mathrm{aut}(Y)$.

5. NKrec

In the file `NKrecs.txt`, we give a list of 7 records `NKrec`, each of which describes the nef-chamber of an Enriques surface Y with finite automorphism group. The components of `NKrec` are as follows.

- `NKrec.type`: The Nikulin-Kondo type of Y (a number between 1 and 7).
- `NKrec.configmat`: The adjacency matrix of the dual graph of the smooth rational curves on Y.

In the figures of Nikulin-Kondo configurations in [2], the nodes are numbered according to this record.
